The room is quieter now. The terminal windows are closed. Notes sit open, with several lines crossed out and rewritten.

Morgan arrives last and does not speak right away.

“Alright,” Morgan says finally. “What surprised you?”

Pat answers first. “How little the system actually needs the password.”

Jordan nods. “And how dangerous it is once it exists anywhere else.”

Morgan leans against the table. “Say more.”

“I thought hashing was the protection,” Jordan says. “But the moment the verification material was outside the login path, the rules didn’t matter anymore.”

Pat adds, “And guessing wasn’t the point. The real risk was predictability and reuse. Once the system stopped rate-limiting, everything changed.”

Morgan nods once.

“That’s the shift,” Morgan says. “Authentication doesn’t fail because cryptography is weak. It fails because credentials leak, spread, and live longer than anyone remembers.”

Jordan looks down at the notes. “I also noticed how important cleanup was. Leaving an account or credential behind felt wrong after seeing how easy it was to misuse.”

“Good,” Morgan says. “Revocation is part of the lifecycle. If you don’t practice it here, you won’t remember it later.”

Pat exhales. “This felt less technical than I expected.”

Morgan smiles faintly. “And more uncomfortable?”

“Yes,” Pat admits. “Because it forced me to be precise about what actually makes pretending to be someone cheap.”

Morgan straightens.

“What you practiced today,” Morgan says, “is how real identity failures are understood after the fact. Not as broken systems, but as ordinary shortcuts that accumulated into exposure.”

The room is still for a moment.

“You don’t need to be fast at this yet,” Morgan says. “You need to be honest. If you can explain where credentials live, how they spread, and what they unlock, the fixes tend to suggest themselves.”

Morgan gathers the remaining papers.

“Clean system. Clear thinking. That’s the standard.”

Nothing remains on the machines. Only the understanding does.
